

# Lab 7 – 802.11

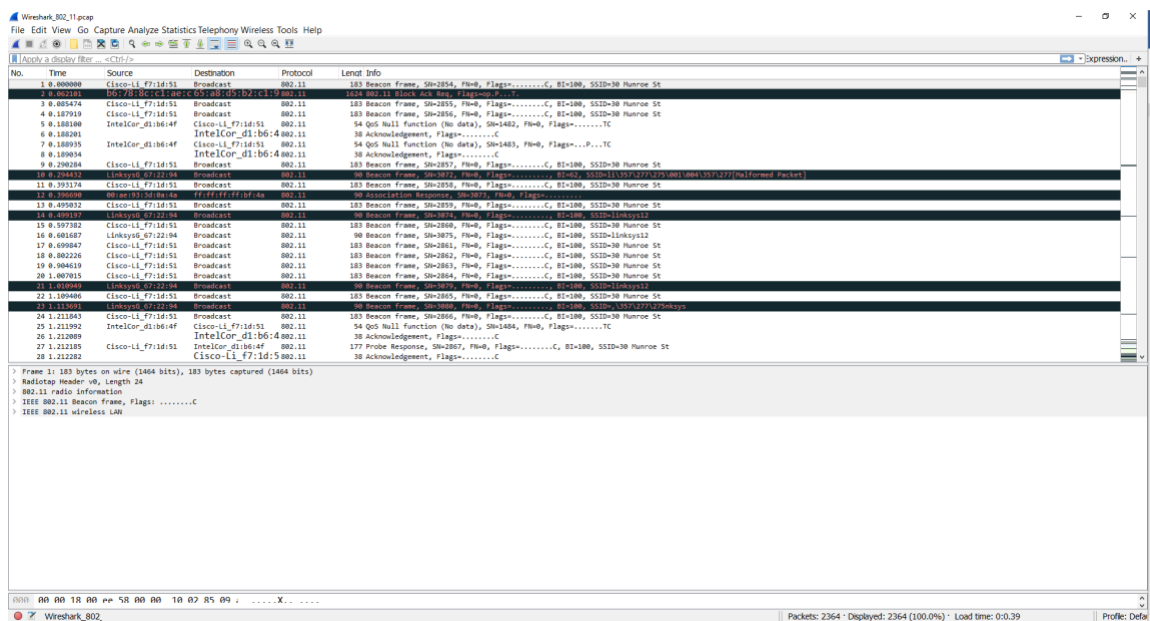

## IT 520-A – Enterprise Infrastructure & Networks

### Instructions:

Download the zip file <http://gaia.cs.umass.edu/wireshark-labs/wireshark-traces.zip> and extract the file `Wireshark_802_11.pcap`. This trace was collected using AirPcap and Wireshark running on a computer in a home network consisting of a Linksys 802.11g combined access point/router, with two wired PCs and one wireless host PC attached to the access point/router. In this trace file, we'll see frames captured on channel 6. Since the host and AP that we are interested in are not the only devices using channel 6, we'll see a lot of frames that we're not interested in for this lab, such as beacon frames advertised by a neighbor's AP also operating on channel 6. The wireless host activities taken in the trace file are:

- The host is already associated with the *30 Munroe St* AP when the trace begins.
- At  $t = 24.82$ , the host makes an HTTP request to `http://gaia.cs.umass.edu/wireshark-labs/alice.txt`. The IP address of `gaia.cs.umass.edu` is `128.119.245.12`.
- At  $t=32.82$ , the host makes an HTTP request to `http://www.cs.umass.edu`, whose IP address is `128.119.240.19`.
- At  $t = 49.58$ , the host disconnects from the *30 Munroe St* AP and attempts to connect to the *linksys\_ses\_24086*. This is not an open access point, and so the host is eventually unable to connect to this AP.
- At  $t=63.0$  the host gives up trying to associate with the *linksys\_ses\_24086* AP, and associates again with the *30 Munroe St* access point.

Once you have downloaded the trace, and unzip it, you can load it into Wireshark and view the trace using the *File* pull down menu, choosing *Open*, and then selecting the `Wireshark_802_11.pcap` trace file. The resulting display should look just like Figure 1.

**Figure 1:** Wireshark window, after opening the `Wireshark_802_11.pcap` file

Recall that beacon frames are used by an 802.11 AP to advertise its existence. To answer some of the questions below, you'll want to look at the details of the "IEEE 802.11" frame and subfields in the middle Wireshark window.

- (For each of these questions, take a screenshot of Wireshark, and attach it to your answer) - Questions without Full Screenshot will not be graded. A lab submission template is available on canvas. Your screenshot should indicate the time and date on your computer.
- Include a terminal screenshot showing your computer IP address on the front page before Question 1, and a full PRINT of the HTTP OK message as the last page.

Lab will NOT be graded if either of these two is missing.

Questions:

1. What are the SSIDs of the two access points that are issuing most of the beacon frames in this trace?
2. What are the intervals of time between the transmissions of the beacon frames the *linksys\_ses\_24086* access point? From the *30 Munroe St.* access point? (Hint: this interval of time is contained in the beacon frame itself).
3. What (in hexadecimal notation) is the source MAC address on the beacon frame from *30 Munroe St*? Recall from Figure 7.13 in the text that the source, destination, and BSS are three addresses used in an 802.11 frame. For a detailed discussion of the 802.11 frame structure, see section 7 in the IEEE 802.11 standards document (cited above).
4. What (in hexadecimal notation) is the destination MAC address on the beacon frame from *30 Munroe St*??
5. What (in hexadecimal notation) is the MAC BSS id on the beacon frame from *30 Munroe St*?
